**Answer All Questions**

**Time: 2 Hours**

---

**Note:** *Answers must be given in the space provided. Write your Index No. top of this page.*

---

1. Let  $A$  be a sorted array of  $n=10$  elements. We are using a binary search to find an element  $k$ . Assume that  $k$  is in the array. Also assume that only one comparison is required to determine whether  $k$  is equal to, less than or greater than  $A[i]$ . What is the average number of comparisons required if  $k$  can be in any arbitrary location? (Hint: If  $k$  is in the middle of the array, then only one comparison is required). [10 marks]

.....

.....

.....

.....

.....

.....

.....

2. Consider the following recursive algorithm, COMP, where  $n$  is a non-negative integer.

```
COMP( $n$ )  
    if  $n = 0$   
        return 0  
    else  
        return ( $2*n + \text{COMP}(n-1)$ )
```

What value will be returned if we invoke this with  $n=6$ ?

[5 marks]

.....

.....

.....

- .....
- .....
3. Give the order of nodes corresponding to *postorder* traversal of the binary tree in the figure shown. [5 marks]

- .....
- .....
- .....
4. For the following running times for algorithms, show the correct relationship among them using the “<” (less than) relation:  $O(n)$ ,  $O(\lg n)$ ,  $O(n \lg n)$ ,  $O(2^n)$ ,  $O(n^2)$ . [5 marks]

- .....
- .....
5. Suppose you have been given the following algorithm which accepts an array  $A[1..n]$  of  $n$  integers as input.

```

for  $i \leftarrow n$  downto 2
     $large \leftarrow A[1]$ 
     $index \leftarrow 1$ 
    for  $j \leftarrow 2$  to  $i$ 
        if  $A[j] > large$ 
             $large \leftarrow A[j]$ 
             $index \leftarrow j$ 
     $A[index] \leftarrow A[i]$ 
     $A[i] \leftarrow large$ 
  
```

Compute the running time of this algorithm and express it in “big oh” notation. [6 marks]

6. What is the purpose of the algorithm given in question 5? (i.e., what is it doing?) [4 marks]

7. Consider the following *fractional-knapsack problem*. Suppose you are given 5 objects with the following weights:

Suppose the following profits are associated with the objects (in the same order):

The knapsack has a weight capacity of 30. The objective is to fill the knapsack while maximizing the total profit. Note that a fraction of an object can be chosen if desired but you may do it only once for one object. Compute the maximum profit possible. [10 marks]

8. Give the asymptotic growth in “big oh” notation for the following functions of  $n > 0$ .

$$8n^9 + n^{2n} + 5n^3 + 3n + 9 \dots\dots\dots$$
$$5\log n + 4^n + 2n + 18 \quad \dots\dots\dots$$
$$15n^5 + (3n + 7)^6 \dots\dots\dots$$
$$9999n + 0.003 n^2 + 0.9^n \dots\dots\dots$$

9. The following algorithm is to find the maximum value in a given integer array,  $A[1..n]$ , of length  $n$ .

```

max ← A[1]
for i ← 2 to n
    // missing part
return max

```

Give the missing part of this algorithm.

[4 marks]

**10.** Give a recursive algorithm corresponding to the following expression to compute  $Ack(m, n)$  for any two given integers  $m, n \geq 0$ . [6 marks]

$$Ack(m,n) = \begin{cases} n+1 & \text{if } m=0 \\ Ack(m-1,1) & \text{if } m \neq 0, n=0 \\ Ack(m-1, Ack(m,n-1)) & \text{otherwise} \end{cases}$$

- 11.** Show the order of vertices visited in the following graph if the graph is traversed

- a) depth-first

- b) breadth-first

starting at vertex S. [6 marks]

- a) .....

- b) .....

12. *Kruskal's algorithm* for computing the minimum-cost-spanning tree (MCST),  $T$ , for a graph,  $G=(V, E)$ , is given below.

```

MCST-Kruskal( $G, W$ )                                     //  $G=(V, E)$ ,  $W$  is the array of weights
   $T \leftarrow \emptyset$ 
  for each vertex  $v \in V$ 
    Make-Set( $v$ )                                         // make separate sets for vertices
  Sort the edges by increasing weight
  for each edge  $(u,v) \in E$ , in sorted order
    if Find-Set( $u$ )  $\neq$  Find-Set( $v$ )                   // if no cycles are formed
       $T \leftarrow T \cup \{(u,v)\}$                        // add edge to tree
      Union( $u,v$ )                                         // combine sets
  return  $T$ 

```

Using this (or other) algorithm, find the MCST for the following graph. [10 marks]

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

13. Suppose you have a 100,000-character data file that you wish to store compactly using a variable-length code. There are 6 different characters that occur. Their frequencies of occurrences are as follows.

Character	$K$	$m$	$n$	$p$	$q$	$s$
Frequency (%)	44	13	11	17	9	6

- a) Show the variable-length codeword for each character obtained using an appropriate algorithm (e.g., Huffman's algorithm). [8 marks]

- b) What is total number of bits needed to represent the original data file using this code? [2 marks]

.....  
 .....  
 .....  
 .....

14. Suppose  $S$  is a stack data structure with the contents  $\{10, 4, 5, 7, 2\}$  where the top element is 10. Then suppose the following code segment is executed on it.

```

 $x \leftarrow \text{POP}(S)$ 
print  $x$ 
 $x \leftarrow \text{POP}(S)$ 
print  $x$ 
PUSH( $S, 3$ )
PUSH( $S, 6$ )
 $x \leftarrow \text{POP}(S)$ 
print  $x$ 
 $x \leftarrow \text{POP}(S)$ 
print  $x$ 

```

After executing the code segment, show

- a) the printed result, and [5 marks]  
 b) the contents of the stack. [5 marks]

a).....

 .....  
 .....  
 .....

b).....  
.....  
.....  
.....  
.....

15. A student, X, tries to prove that a problem Y is **NP**-complete using the following steps, in that order.

- (i) X shows that Y is in **NP**
- (ii) X selects a known **NP**-complete problem Z
- (iii) X shows how Y can be polynomially reducible to Z
- (iv) X therefore concludes Y is **NP**-complete

Is this approach correct or incorrect? Explain your answer. [5 marks]
